

# DIRECTIONS

- 1) Before installing your new Pivot Flusher, a one-time pre-flush of your irrigation pivot is recommended. This can be accomplished by removing the end cap or drain plug at the end of the overhang.
- 2) The Pivot Flusher should be installed at the far end of the overhang on your irrigation pivot. This will ensure cleanliness through the entire system.
- 3) Locate the 2" drain plug at the end of the overhang. If your irrigation pivot does not have a drain plug, you can modify the end of the overhang by installing a 2" elbow that the Pivot Flusher can mount too.
- 4) When installing the Pivot Flusher, using "NEVER SIEZE" is recommended.
- 5) Install the Pivot Flusher by turning clockwise into the 2" fitting at the end of the overhang.

**NOTE:** The Pivot Flusher may leak after installation, because the Puck will take a few uses to seat to the inner ring. Pivot Flusher requires a minimum of 12 PSI at the end of the pivot to completely close. It is recommended to have 15 PSI to ensure trouble free usage.
